Periodic Table of the Elements

Small text: 2000 copyright. Names printed in Roman letters usually denote stable isotopes. Complete names and atomic symbols are given in parentheses from 104 to 118.

H	He																	Hg	Pt
Li	Be											B	C	N	O	F	Ne	Cu	Zn
Na	Mg											Al	Si	P	S	Cl	Ar	Ni	Co
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br	Kr		
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I	Xe		
Cs	Ba	La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn		
Fr	Ra	Ac	Rf	Mo	Tc	Hf	Rf	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn	
		La	Ce	Pr	Nd	Pm	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb				
		Ac	Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No

Lewis Dot Structures

Gateway to Understanding Molecular Structure

---

---

---

---

---

---

---

---

Slide 3

Drawing Lewis Dot Structures

1. Determine the total number of valence electrons.
2. Determine which atom is the "central" atom.
3. Stick everything to the central atom using a single bond.
4. Fill the octet of every atom by adding dots.
5. Verify the total number of valence electrons in the structure.
6. Add or subtract electrons to the structure by making/breaking bonds to get the correct # of valence electrons.
7. Check the "formal charge" of each atom.

Slide 5

Dot structure for  $\text{SO}_3^{2-}$

1. Total number of valence electrons:  
 $6 + (3 \times 6) + 2$  for the charge = 26
2. Central Atom  
S is below O (leftmost, downmost)
3. Stick all terminal atoms to the central atom using a single bond.

---

---

---

---

---

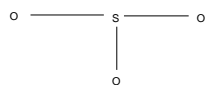

---

---

---

Slide 6

Stick all terminal atoms to the central atom using a single bond.

```
o — s — o
    |
    o
```

---

---

---

---

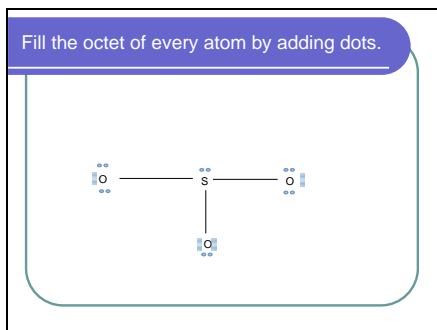

---

---

---

---

Slide 7

Slide 8

---

---

---

---

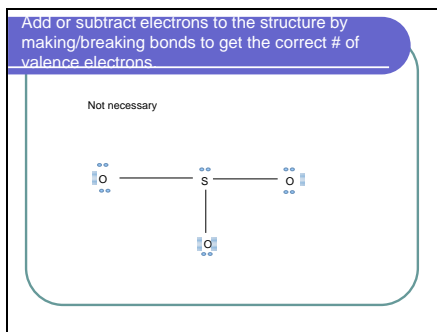

---

---

---

---

Slide 9

---

---

---

---

---

---

---

---

Slide 10

Check Formal charges:

FC = # valence e<sup>-</sup> - # bonds - # electrons  
FC(S) = 6 - 3 - 2 = +1  
FC(O) = 6 - 1 - 6 = -1  
They're OK - not great

[O-]S([O-])[O-]

---

---

---

---

---

---

---

---

Slide 11

It's sulfur, it can expand.

If we make an extra bond to sulfur then...  
FC(S) = 6 - 4 - 2 = 0  
FC(O=S) = 6 - 2 - 4 = 0  
FC(O-S) = 6 - 1 - 6 = -1  
BETTER! And we get resonance!

[O-]S(=O)[O-]

---

---

---

---

---

---

---

---

Slide 12

Resonance

Same structure, different arrangement of electrons

[O-]S(=O)[O-]   [O-]S(=O)[O-]   [O-]S(=O)[O-]

---

---

---

---

---

---

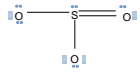

---

---

Slide 13

Once I have a Lewis Structure...

Geometry is automatic based on number of electron groups!

Central atom has 4 electron groups: 3 bond groups + pair of electrons.

---

---

---

---

---

---

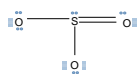

---

---

Slide 14

Electron vs. molecular

4 electron groups = tetrahedral e-geometry

4 electron groups – 1 pair of electrons = trigonal pyramidal molecular geometry

---

---

---

---

---

---

---

---

Slide 15

Shape is half the issue...

Shape determines how the molecules can approach each other. (Remember trying to hug someone with a leg sticking out of their chest.)

Charge is the other half.

Opposites attract. Polarity is velcro.

---

---

---

---

---

---

---

---

Slide 16

---

---

---

---

---

---

---

---

Slide 17

O (EN = 3.5)  
S (EN = 2.5)

Not the same. The difference is 1.0. What kind of bond is this?

POLAR covalent.

---

---

---

---

---

---

---

---

Slide 18

Each bond is polar...

What about the molecule?

We need to consider shape and whether the polarities cancel.

It's trigonal pyramidal!

---

---

---

---

---

---

---

---
